UNIFORM EARTAG NUMBER PLAN  
(for the identification of cattle)

Three years ago a uniform eartag number plan was developed to provide an eartag number series that could be used universally in all disease eradication, health and improvement programs. The uniform eartag number series developed has a two-digit State code, three-letter prefix, followed by four digits, as:

25 AAA 0001

This number series provides for more than 175 million different numbers in each State -- enough to insure there will be no duplication of numbers for many decades if the series is used in all disease eradication, health, and improvement programs in each State, even in the largest livestock States.

The first advantage of the uniform eartag numbering plan is that an animal need carry but one eartag for all programs, as the eartag number will not be duplicated.

The second, and equally important advantage, is that the identification records (eartag numbers) can be used in handling and processing records on electronic data processing equipment, as the number is of uniform length -- 7 digits -- and there is no possibility of duplication of numbers.

The uniform eartag numbering plan has been adopted by the American Dairy Science Association and the National Association of Artificial Breeders, and is being used in DHIA and AB programs. The plan has been presented to the State animal disease control officials and is being used in animal disease eradication programs in many States. A recent survey of the use of the uniform eartag numbering plan in cooperative disease eradication programs reveals the following:

- (a) States in which plan has not been adopted: Kansas, Wisconsin, Illinois, Mississippi, Louisiana, Vermont, Maine, Rhode Island and Massachusetts.
- (b) States in which plan has been partially adopted: New Mexico, Texas, Tennessee, North Carolina and Maryland.
- (c) All other States have the plan in operation.

On the next page is a joint statement by the Animal Disease Eradication and the Animal Husbandry Research Divisions of the U. S. Department of Agriculture and the National Association of Artificial Breeders, pointing out that these agencies have officially adopted the uniform eartag numbering plan to identify cattle in herd improvement and animal disease eradication programs.

UNIFORM EARTAG NUMBERING PLAN  
(for the identification of cattle)

The satisfactory identification of all cattle in disease eradication programs, dairy herd improvement activity, and artificial breeding programs is of utmost importance. Positive and permanent identification of individual animals and accurate records that reflect the location, movement, health status, production and reproduction of each animal are essential.

Based on previous experience with a controlled eartag numbering system in the Dairy Herd Improvement program, a numbering plan was devised that can be used effectively in all States. It provides for the positive identification of cattle in all disease eradication, health, and improvement programs. The identifying eartag number consists of a two-digit State code, three-letter prefix, followed by four digits.

The National Association of Artificial Breeders' and the Animal Disease Eradication and the Animal Husbandry Research Divisions of the Agricultural Research Service, United States Department of Agriculture, have officially adopted the uniform eartag numbering plan used to identify cattle in herd improvement and animal disease eradication programs.

Specific series of numbered tags are assigned for the use of each program activity; however, after a tag is applied it becomes a permanent identification and is used to identify the animal in all programs. No duplication of numbers occurs in any part of the country. This is particularly important as the handling and processing of the records involved will become more and more automated through the further use of electronic data processing equipment.

Dairy Herd Improvement Associations and Artificial Breeding Organizations are using the uniform numbering system in all States. The system is used in 38 States in cooperative animal disease eradication. Its use is being contemplated by officials in some additional States. Substantial savings would follow the nationwide adoption of the uniform numbering system for all eartags.

# DHIA PROVED-SIRE RECORDS TABULATED IN APRIL 1959

Following is a list of 352 sires whose records were tabulated or retabulated by the Animal Husbandry Research Division in April 1959. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., \*12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., \*May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
